

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An image sensor array comprising:  
a plurality of pixels arranged in rows and columns, each  
pixel including a contact pad and pixel circuitry connected to  
the contact pad;

a passivation layer formed between the pixel circuitry and  
the contact pad of each of the plurality of pixels, wherein the  
contact pad of each pixel is formed on a first surface of the  
passivation layer and connected to corresponding pixel circuitry  
by a via structure passing through the passivation layer;

a plurality of passivation walls extending from the first  
surface of the passivation layer and defining a plurality of  
trenches, each trench being surrounded by corresponding sections  
of the plurality of passivation walls, each of the plurality of  
passivation walls having upper edges, wherein the contact pad of  
each pixel is located in an associated trench such that an upper  
surface of the contact pad is located below between the first  
surface of the passivation layer and the upper edges of the  
passivation walls; and

a sensor layer formed over the plurality of passivation  
walls and having lower portions extending into the  
trenches, wherein each lower portion of the sensor layer abuts  
the upper surface of an associated pixel contact pad.

2. (Original) The image sensor array according to Claim 1,  
wherein the sensor layer is an amorphous silicon (a-Si:H) layer  
further comprising:

an upper region that is doped with a p-type dopant; and

an undoped central region that is located between the upper  
region and the lower portions,

wherein the lower portions of the a-Si:H layer that are  
doped with an n-type dopant, and

wherein the passivation walls extend into the central,  
relatively undoped region of the a-Si layer.

3. (Original) The image sensor array according to Claim 1, further comprising a conductor formed below each of the passivation walls, wherein the conductor is connected to a low voltage source such that the conductor generates a field that impedes the flow of electrons from a metal contact pad of a first pixel to a metal contact pad of a second pixel via the passivation wall.

4. (Original) The image sensor array according to Claim 3, wherein portions of selected conductors extend under the contact pad of associated pixels such that a capacitor is formed by each portion and the contact pad of the associated pixel.

5. (Original) The image sensor array according to Claim 1, wherein the sensor layer is an amorphous silicon (a-Si:H) layer further comprising an upper region that is doped with a p-type dopant, and a central region that is located between the upper region and the lower portions, and  
wherein the central region and the lower portions of the a-Si:H layer are undoped.

6. (Original) The image sensor array according to Claim 1, wherein side surfaces of the passivation walls are sloped such that the lower portion of the a-Si:H layer forms an angle in the range of 45° and 60° relative to the upper surface of the contact pad.

7. (Original) The image sensor array according to Claim 6, further comprising a conductor formed below each of the passivation walls, wherein the metal structure is connected to a low voltage source such that the metal structure generates a field that impedes the flow of electrons from a metal contact pad of a first pixel to a metal contact pad of a second pixel via the passivation wall.

8. (Original) The image sensor array according to Claim 6, wherein the passivation walls are formed from a material selected from the group consisting of SiO<sub>2</sub>, SiON, and benzocyclobutene (BCB).

9. (Currently Amended) A image sensor array comprising:  
a plurality of pixels including a first pixel having a first contact pad and a second pixel having a second contact pad that is separated from the first contact pad by an elongated interface region, wherein the first pixel further includes pixel circuitry located below the first contact pad, the pixel circuitry;

a continuous sensor layer formed over the plurality of pixels and having lower portions contacting the first and second contact pads, respectively; and

a plurality of conductors including a first conductor located between the pixel circuitry and the first contact pad and extending under the interface region separating the first and second contact pads,

wherein the plurality of conductors are connected to a low voltage source such that the first conductor generates a field that impedes the flow of electrons across the interface region from the first contact pad of the first pixel to the second contact pad of the second pixel.

10. (Original) The image sensor array according to Claim 9, wherein the first conductor further comprises a portion extending under the first contact pad such that a capacitor is formed by the portion and the first contact pad.

11. (Original) The image sensor array according to Claim 9, further comprising a passivation layer including portions provided in the interface region separating the first and second contact pads.

12. (Original) The image sensor according to Claim 11, wherein the passivation layer defines a plurality of trenches and the portions of the passivation layer comprise passivation walls surrounding the trenches, each of the passivation walls having upper edges, and

wherein the first contact pad is located in a first trench and the second contact pad is located in a second trench adjacent to the first trench such that a first passivation wall is located between the first contact pad and the second contact pad, and such that the upper surfaces of the first and second contact pads are located below the upper edge of the first passivation wall.

13. (Original) The image sensor array according to Claim 12, wherein the passivation walls are formed from a material selected from the group consisting of SiO<sub>2</sub>, SiON, and benzocyclobutene (BCB).

14. (Original) The image sensor array according to Claim 12, wherein the passivation walls are sloped such that the lower portions of the central region of the continuous sensor layer define an angle in the range of 45° and 60° relative to the upper surface of the contact pad.

15. (Original) The image sensor array according to Claim 9, wherein the continuous sensor layer is an amorphous silicon (a-Si:H) layer further comprising:

an upper region that is doped with a p-type dopant; and

an undoped central region that is located between the upper region and the lower portions,

wherein the lower portions of the a-Si:H layer that are doped with an n-type dopant, and

wherein the passivation walls extend into the central, relatively undoped region of the a-Si:H layer.

16. (Original) The image sensor array according to Claim 9,  
wherein the continuous sensor layer is an amorphous silicon  
(a-Si:H) layer further comprising an upper region that is doped  
with a p-type dopant, and a central region that is located  
between the upper region and the lower portions, and  
wherein the central region and the lower portions of the a-  
Si:H layer are undoped.
